MY TEXTILE

2026 EDITION

SUSTAINABILITY REPORT

Commitments, baseline requirements and proposed action plan

Home and hospitality textiles
Karachi, Pakistan

Information cutoff: 14 November 2026
No measured environmental or independently assured results are reported.

01 / REPORTING BASIS

Scope and accountability

This first edition sets out a proposed sustainability agenda. It is not a historical performance assessment or an independently assured disclosure.

Company boundary

MY TEXTILE is a sole proprietorship led by Muhammad Yasir Waheed. The proprietor confirmed the establishment date as 3 February 2024 and a total workforce of 55 people, including himself. The stated product scope covers towels, bedding, kitchen and table linen, curtains and hospitality linen.

Locations and operational scope

Registered office: Bungalow No. B-301/64, Block 13-B, Gulshan-e-Iqbal, Karachi, Sindh 75300. Factory address supplied by the proprietor: Plot 15, Sector 19, Korangi Industrial Area, Karachi, Sindh 74900. The split between in-house and outsourced processes has not been confirmed. All improvement actions therefore begin with an operational-scope review.

Status	Meaning in this report
Company information	Identity, product scope, workforce and addresses supplied by the proprietor.
Commitments / proposed actions	Recommended direction for management consideration. Implementation is not established.
Performance information	Utility, emissions, water, waste, injury and supplier-audit data were not supplied. No results, reductions or compliance achievements are inferred.

Reporting approach: a company-specific planning document. No claim of conformity with GRI, ISSB, an ISO standard or a sustainability certification is made.

02 / MATERIALS AND WASTE

Resource use and product information

The first priority is to understand material inputs and waste streams before setting reduction targets.

Proposed commitment

Improve the accuracy of material records and identify opportunities to reduce avoidable losses while maintaining the agreed product specification. Claims such as organic, recycled or certified fibre should depend on evidence for the particular material and supply chain.

Proposed action	Evidence to establish
Map material inputs	Record fabric, yarn, trims and packaging purchases by material type and unit. Confirm the processes controlled directly by MY TEXTILE.
Track cutting and handling losses	Record offcuts, rejected pieces and packaging waste separately. Identify how each stream is stored and transferred.
Assess recovery options	Review feasible reuse or recovery channels and retain collection records. Do not describe material as recycled unless its actual destination is established.
Review packaging	Document packing requirements. Assess opportunities to remove unnecessary material without compromising product protection.

Baseline indicators to develop

Material input by type; usable output where measurable; textile waste by route; and packaging purchased by type. Measurement units and reporting boundaries should remain consistent between periods.

Current position: no waste quantities, recycled-content percentages, recovery rates or packaging reductions have been verified for this report.

03 / ENERGY AND CLIMATE

An evidence-based energy baseline

Energy and emissions planning should follow an inventory of the processes, premises and equipment actually controlled by the business.

Proposed commitment

Understand energy consumption and assess feasible efficiency improvements. Avoid claims of renewable-energy use, carbon neutrality or emissions reduction until records support the claim and its boundary.

Workstream	Proposed first step
Electricity	Collect utility bills and meter readings. Record which premises each account covers.
Fuel and backup generation	Identify fuels used and retain purchase or consumption records. Confirm ownership and control of equipment.
Efficiency review	Review operating hours, idle equipment and maintenance needs. Assess changes before making investment commitments.
Emissions inventory	Consider an inventory after activity data and boundaries are established. Document the methodology, factors and assumptions if calculations are prepared.

Decision rules for future targets

Select a complete baseline period first. Use absolute consumption and, where meaningful, a clearly defined production denominator. Distinguish estimated data from meter readings and compare periods with consistent scope.

Current position: no kWh, fuel totals, greenhouse-gas inventory, solar installation, renewable share or reduction target has been substantiated. Targets will require a separate management decision after baseline review.

04 / WATER AND PROCESSING

Water stewardship starts with scope

The water profile depends on whether operations involve only textile make-up or also washing, dyeing and other wet processes. That process boundary requires confirmation.

Proposed commitment

Establish the sources, uses and discharge routes of water at controlled premises. Where external processors handle wet processing, request relevant information without assuming that their performance represents MY TEXTILE’s own operations.

Priority	Proposed action
Map water use	Identify each water source, meter, major use and responsible location. Distinguish site use from external processing.
Record consumption	Retain readings, bills or other suitable records. Document estimated quantities and missing information.
Understand wastewater	Confirm whether effluent arises, where it goes and who handles it. Seek competent advice where treatment or discharge controls require assessment.
Review processing chemicals	If chemicals are used, establish a product inventory, handling information and responsible storage arrangements. Review processor information where operations are outsourced.

Baseline indicators to develop

Water withdrawal by source and location; known discharge routes; relevant process records; and any documented treatment or testing information applicable to the operation.

Current position: no water-reuse rate, effluent-treatment plant, zero-discharge achievement, chemical-compliance status or water certification is claimed.

05 / PEOPLE AND WORKPLACE

Safety, dignity and clear records

The proprietor reports 55 people in the business, including himself. Employment conditions and safety performance have not been independently reviewed.

Proposed commitment

Support a respectful workplace and build a clear record of responsibilities, working arrangements and safety needs. Policies should apply to the actual operation and be communicated in language workers understand.

Area	Proposed review
Workplace safety	Review site hazards, emergency arrangements, machine-related risks and task-specific protection needs with competent personnel.
Training and participation	Record induction and task training. Provide a route for workers to raise safety concerns and improvement suggestions.
Employment records	Review the completeness of employment, attendance and pay records. Establish a process for addressing discrepancies.
Respect and grievance handling	Develop a clear route for concerns, with appropriate confidentiality and protection from retaliation. Explain who receives and follows up concerns.

Indicators to establish

Workforce composition and boundary; recorded training; incidents and corrective actions; and concerns received and resolved using suitable privacy safeguards. The absence of supplied records must not be reported as zero incidents.

Current position: no injury rate, accident-free record, training total, wage-compliance finding or social-audit approval is reported.

06 / SUPPLY CHAIN AND GOVERNANCE

Responsibility beyond the product

Supplier relationships and customer requirements should be supported by traceable information and proportionate checks.

Proposed supplier approach

Establish a supplier and processor register that distinguishes material supply, manufacturing services and logistics. Record the product or service scope, relevant documents and commercial responsibility. Prioritise review according to the actual activity and identified risks.

Product and claims integrity

Confirm material composition, construction and other agreed specifications in the product records. Check any certificate for the correct holder, scope, validity and relevance. Do not extend a supplier’s certificate to the whole business or all products without a valid basis.

Proposed management responsibility	Record or output
Sole Proprietor	Approve the operational boundary, nominate record owners and review proposed priorities.
Nominated operations / administration personnel	Maintain activity records, document gaps and report issues. These roles are proposed, not confirmed appointments.
Supplier / processor contacts	Provide information within their actual scope, subject to verification.
Periodic management review	Review data completeness, proposed actions and unresolved concerns before publishing performance claims.

No named brand relationships, supplier audits, environmental approvals or sustainability certifications are asserted. The report does not establish legal compliance or replace a site assessment.

07 / PROPOSED NEXT STEPS

A staged sustainability programme

The periods below are proposed planning stages after management adopts this programme. They are not promises of completed work or assured outcomes.

Stage	Proposed focus	Expected record
Months 1-3	Confirm in-house and outsourced activities. Assign record owners. Collect available material, utility and workforce records.	Scope map and baseline-data register
Months 4-6	Review data gaps and prioritise resource, safety and supplier-information needs.	Gap review and prioritised action list
Months 7-9	Assess feasible improvements, responsibilities and costs. Implement only separately approved actions.	Approved action records and supporting evidence
Months 10-12	Review data quality and progress. Decide whether reliable performance indicators and future targets can be published.	Management review and next-edition plan

Information needed for the next edition

Confirm the operating process map and outsourcing boundary. Supply electricity and fuel records, water information, material purchases, waste transfer records, employment and safety records, and any applicable valid certificates or test reports. A future performance report should identify reporting periods, methods, limitations and evidence.
